

KAI Overview

KAI is a self-hosted knowledge assistant that answers questions from your own documents. It retrieves the most relevant passages, reranks them, and grounds every answer in cited sources.

Its core guarantee is to never fabricate an answer. When KAI is not confident that the retrieved context supports an answer, it escalates the question to a human instead of guessing.

The retrieval architecture combines dense vector search with lexical keyword search, fusing the two result lists with reciprocal rank fusion before a cross-encoder reranks the final candidates.
